## Solutions to Problem Set 1: Stanford University

**Question 1:** Prove that the equation  $x^2 - 2y^2 = 1$  has infinitely many solutions in positive integers.

**Answer:** Let  $x = u^2 + v^2$  and  $y = uv$ . Then  $x^2 - 2y^2 = (u^2 + v^2)^2 - 2(uv)^2 = (u^2 - v^2)^2$ . Thus,  $x^2 - 2y^2$  is a perfect square, and hence has infinitely many solutions in positive integers.

**Question 2:** Find all the solutions to the equation  $x^2 + y^2 = 100$ .

**Answer:** The solutions are (6, 8), (8, 6), (0, 10), (10, 0), (1, 9), (9, 1), (2, 8), (8, 2), (3, 7), (7, 3), (4, 6), (6, 4), (5, 5).

**Question 3:** Prove that the sum of two squares is never a perfect cube.

**Answer:** Suppose that the sum of two squares is a perfect cube. Then we can write  $x^2 + y^2 = z^3$ . But the cube of an odd number is odd, and the sum of two squares is even. Therefore,  $x^2 + y^2$  cannot be a perfect cube.

**Question 4:** Find all the positive integer solutions to the equation  $x^2 + y^2 + z^2 = 100$ .

**Answer:** The solutions are (6, 8, 10), (10, 6, 8), (8, 10, 6), (0, 10, 10), (10, 0, 10), (10, 10, 0), (1, 9, 10), (9, 1, 10), (10, 9, 1), (2, 8, 10), (8, 2, 10), (10, 8, 2), (3, 7, 10), (7, 3, 10), (10, 7, 3), (4, 6, 10), (6, 4, 10), (10, 6, 4), (5, 5, 10), (10, 5, 5).

**Question 5:** Prove that the equation  $x^2 + y^2 - z^2 = 1$  has no solutions in positive integers.

**Answer:** Suppose that the equation  $x^2 + y^2 - z^2 = 1$  has a solution in positive integers. Then we can write  $x^2 + y^2 = z^2 + 1$ . But the sum of two squares is never a perfect square, and the sum of a perfect square and 1 is always odd. Therefore,  $x^2 + y^2 - z^2$  cannot be equal to 1.
