### What is Activity Analysis?

Activity analysis is a systematic process in occupational therapy that examines the components, demands, and sequencing of an activity to determine its therapeutic value and suitability for a patient's rehabilitation plan.

### What is Task Analysis in Occupational Therapy?

Task analysis is a specific type of activity analysis that focuses on identifying the steps and subcomponents involved in performing a specific task. It helps therapists break down complex tasks into manageable units to facilitate patient training and skill development.

### Principles of Activity Analysis

- **Holistic Approach:** Considers the activity as a whole, including its social, cognitive, physical, and emotional aspects.
- **Multi-Dimensional:** Evaluates the activity across five components: physical, cognitive, affective, sensory-motor, and socio-cultural.
- **Contextual:** Takes place within a specific environment and considers the patient's functional needs and abilities.
- **Individualized:** Tailored to the unique characteristics and goals of each patient.

### How to Write an Activity Analysis

1. **Define the Activity:** Clearly state the purpose and nature of the activity.
2. **Describe the Components:** List the physical, cognitive, affective, sensory-motor, and socio-cultural components involved in the activity.
3. **Analyze the Demands:** Identify the specific demands and requirements of the activity, such as physical exertion, cognitive load, and social interaction.
4. **Determine the Sequencing:** Outline the steps and subcomponents involved in performing the activity in a logical order.
5. **Consider Modifications:** Suggest modifications or adaptations to the activity to enhance its therapeutic value or to meet the patient's specific needs.

### **Performance Analysis in OT**

Performance analysis is an extension of activity analysis that evaluates an individual's execution of an activity. It focuses on identifying performance patterns, errors, and areas for improvement to enhance occupational performance.

### **Components of Task Analysis**

- **Objective:** The goal or outcome of the task.
- **Actions:** The steps or subcomponents required to complete the task.
- **Materials:** The objects or resources needed to perform the task.
- **Environment:** The setting or context in which the task is performed.

### **Difference between Task Analysis and Activity Analysis**

Activity analysis focuses on the overall structure and demands of an activity, while task analysis emphasizes the specific steps and subcomponents involved in its execution.

### **Is Activity Analysis an Assessment Tool?**

Yes, activity analysis is an assessment tool used in occupational therapy to evaluate a patient's functional abilities, identify areas for improvement, and develop individualized rehabilitation plans.

### **Who Uses Activity Analysis?**

Occupational therapists use activity analysis to design and implement therapeutic interventions for individuals with disabilities, injuries, or other conditions that affect their occupational performance.

### **Example of a Task Analysis**

- Objective: To make a peanut butter and jelly sandwich
- Actions:
  - Gather ingredients (bread, peanut butter, jelly)
  - Spread peanut butter on one slice of bread
  - Spread jelly on the other slice of bread
  - Put the two slices of bread together
  - Cut the sandwich in half (optional)
- Materials: Bread, peanut butter, jelly, knife (optional)

### **Factors of Activity Analysis**

- Purpose of the activity
- Physical demands
- Cognitive demands
- Affective demands
- Sensory-motor demands
- Socio-cultural demands

### **Activity Demands in Occupational Therapy**

- Physical: Strength, endurance, mobility
- Cognitive: Attention, memory, problem-solving
- Affective: Motivation, self-efficacy
- Sensory-motor: Coordination, balance
- Socio-cultural: Social interaction, cultural norms

### **How to Analyze an Activity**

---

- Observe the patient performing the activity.
- Break the activity down into its component parts.
- Identify the demands and requirements of each component.
- Determine the sequencing of the components.
- Consider the patient's functional abilities and goals.

## **OT Performance Skills**

- Activity analysis
- Task analysis
