**Workouts in Intermediate Microeconomics 8th Edition Solutions: A Comprehensive Guide**

### **Understanding the Concept**

Workouts in Intermediate Microeconomics, 8th Edition, is a valuable resource for students striving to master the intricacies of the subject. These workouts consist of a series of exercises designed to reinforce key concepts, challenge critical thinking skills, and enhance problem-solving abilities. By utilizing these solutions, students can gain a deeper comprehension of intermediate microeconomic principles.

### **Exercise 1: The Law of Demand**

**Question:** Suppose the price of a good increases from \$10 to \$12. The quantity demanded falls from 100 units to 80 units. Calculate the price elasticity of demand.

**Solution:** The elasticity of demand is calculated as  $(\Delta Q / \Delta P) (P / Q)$ , where  $\Delta Q$  is the change in quantity demanded,  $\Delta P$  is the change in price,  $P$  is the average price, and  $Q$  is the average quantity demanded. Thus, elasticity =  $[(80-100) / (12-10)] (11 / 90) = -6.67$ .

### **Exercise 2: The Production Function**

**Question:** A firm's production function is given by  $Q = f(L) = 10L - L^2$ . Find the marginal and average product of labor at  $L = 10$ .

**Solution:** The marginal product of labor is the change in output resulting from a one-unit increase in labor, which is given by  $dQ / dL = 10 - 2L$ . At  $L = 10$ , the marginal product is  $10 - 2(10) = 0$ . The average product of labor is the total output divided by the number of units of labor, which is given by  $Q / L = (10L - L^2) / L = 10 - L$ . At  $L = 10$ , the average product is  $10 - 10 = 0$ .

### Exercise 3: Perfect Competition

**Question:** A perfectly competitive firm is producing at the point where its marginal cost is \$5 and its marginal revenue is \$6. What is the firm's profit-maximizing output level?

**Solution:** In perfect competition, a firm maximizes profit by producing at the point where marginal cost equals marginal revenue. Therefore, the profit-maximizing output is the quantity where  $MC = MR$ , which in this case is the quantity associated with the output level where  $MC = \$5$  and  $MR = \$6$ .

### Exercise 4: Monopoly

**Question:** A monopolist faces a demand curve given by  $P = 100 - Q$  and has a cost function given by  $TC = 100 + 5Q$ . Find the profit-maximizing price and quantity.

**Solution:** The profit-maximizing condition for a monopolist is  $MR = MC$ . The marginal revenue is  $dR / dQ = 100 - 2Q$ , and the marginal cost is  $dTC / dQ = 5$ . Thus,  $100 - 2Q = 5$ , which implies  $Q = 47.5$  units. Substituting this into the demand curve gives  $P = 100 - 47.5 = \$52.50$ .

### Exercise 5: Game Theory

**Question:** Consider a game between two firms: Firm A and Firm B. Firm A can choose to enter or not enter a new market, while Firm B can choose to compete or cooperate. The payoffs are as follows:

Firm B	Compete	Cooperate
--------	---------	-----------

<b>Firm A Enters</b>	(-5, -5)	(5, 5)
<b>Firm A Does Not Enter</b>	(0, 0)	(0, 0)

Analyze this game and find the Nash equilibrium.

**Solution:** The Nash equilibrium is the strategy combination that maximizes the payoff of each firm given the strategy of the other firm. In this case, the Nash equilibrium is for Firm A to enter the market and for Firm B to cooperate, resulting in a payoff of (5, 5).
