**What is chemical bonding answers?** It is a force of attraction that holds the atoms/ions with each other to form a molecule or between the molecules to form a substance. It is responsible for the various atoms or molecules to stay together. In the formation of chemical bonds, the energy is released.

**What are chemical bonding class 11 notes?** A chemical bond is formed by mutual sharing or the transfer of one or more electrons. As a result, each combining atom develops a stable noble gas electronic structure, having 8 electrons in its outermost shell.

**What is chemical bonding in NEET Vedantu?** A chemical bond is an attractive force that holds various constituents (atoms, ions, etc.) together in different chemical species together. Energy is released during the formation of a chemical bond.

**What is a chemical bond in very short notes?** A chemical bond is that permits chemical compounds to develop connecting atoms, ions, or molecules. Covalent bonds are produced by the sharing of electrons, whereas ionic bonds are created by the electromagnetic force of difference in electronegativity. A chemical bond is an atom-to-atom attraction.

**What are the 7 types of chemical bonds?**

**What is the strongest bond in chemistry?** Hint: Covalent bonds are known to be the strongest and the bonds formed via Van der Waals forces are known to be the

weakest. The ranking from strongest to weakest bonds is: Covalent bond  $\gg$  ionic bond  $\gg$  hydrogen bond  $\gg$  Van der Waals forces.

**What is Fajans rule class 11?** Fajan's rule is stated on the basis of the concept of polarization which states that the covalent nature of an anion increases with an increase in its polarization. The two main factors that affect the extent of polarization of an anion are the polarizing power of the cation and the polarizability of the anion.

**What is octet rule class 11?** The octet rule dictates that atoms are most stable when their valence shells are filled with eight electrons.

**What is chemical bonding explained simply?** chemical bonding, any of the interactions that account for the association of atoms into molecules, ions, crystals, and other stable species that make up the familiar substances of the everyday world.

**What is the bonding answer?** Bonding is the interaction between the atoms or ions that binds them together to form a bond. The molecule becomes stable by bonding resulting in an overall loss of energy. The stronger the bond more stable the compound. Types of bonding include covalent bonding, ionic bonding, and polar bonding.

**Why is chemical bonding?** Why form chemical bonds? The basic answer is that atoms are trying to reach the most stable (lowest-energy) state that they can. Many atoms become stable when their valence shell is filled with electrons or when they satisfy the octet rule (by having eight valence electrons).

**What is the meaning of chemically bonded?** A chemical bond is defined as the force of attraction which holds the constituents atom together in a molecule. Chemical bonding is basically the process of forming bonds between atoms and molecules.
