Question 1: What is the derivative of a function? Answer: The derivative of a function is the rate at which the function changes with respect to its input. It measures the slope of the function's graph at a given point.

Question 2: What is the integral of a function? Answer: The integral of a function is the area under the function's graph over a given interval. It represents the net change in the function's value over that interval.

Question 3: How is analytic geometry used in calculus? Answer: Analytic geometry provides a graphical representation of functions and curves, which can be used to visualize concepts and solve problems in calculus. For example, the shape of a parabola can be analyzed using its algebraic equation and graphed in the coordinate plane.
