What was the two-party system Quizlet? What is a two-party system? A party system in which two major parties regularly win the vast majority of votes in general elections, regularly capture nearly all of the seats in the legislature, and alternately control the executive branch of government.

Why were Bostonians angry with British troops in their town? On March 5, 1770, the Bostonians were fuming over taxes and constant surveillance by the British military, both of which had started two years prior. As a result, a small disagreement between a wigmaker apprentice and a soldier easily escalated to a small riot.

When marginal product of labor is increasing, it is usually due to gains from worker specialization.? The marginal product of labor (MPL) measures the change in the total output of a firm when it hires an additional unit of labor. However, the MPL initially rises as more unit of labor is employed because the division and specialization of labor cause the total output to rise by a higher proportion.

What is gained from worker specialization? Specialization Leads to Economies of Scale As labor is divided amongst workers, workers are able to focus on a few or even one task. The more they focus on one task, the more efficient they become at this task, which means that less time and less money is involved in producing a good.

Why are there 2 party systems? Advantages. Some historians have suggested that two-party systems promote centrism and encourage political parties to find common positions which appeal to wide swaths of the electorate. It can lead to

political stability, which leads, in turn, to economic growth.

What is the winner-take-all rule? A winner-take-all electoral system is one where a voting bloc can win all seats in a legislature or electoral district, denying representation to any political minorities. Such systems are used in many major democracies.

What finally forced the British to leave Boston? Using artillery captured by an expedition led by Henry Knox from Fort Ticonderoga and Crown Point, Washington's forces aimed cannons at British ships anchored in the harbor. On 17 March, the British were finally forced to evacuate Boston.

Why did the colonists throw snowballs? The colonists were angry about being unfairly taxed and angry at the British occupation and took their anger out on the troops, as they threw snowballs and other items. Eventually, things escalated until several colonists were killed.

Which two British acts angered Bostonians? Beginnings of Colonial Opposition. American colonists responded to the Sugar Act and the Currency Act with protest. In Massachusetts, participants in a town meeting cried out against taxation without proper representation in Parliament, and suggested some form of united protest throughout the colonies.

What input is often the easiest to vary in the short run? In the short run, not all inputs can be changed to increase production. Often, the easiest input to increase is labor when a production increase is needed.

Why do diseconomies of scale happen? Diseconomies of scale happen when a company or business grows so large that the costs per unit increase. It takes place when economies of scale no longer function for a firm.

When money escapes from the economic flow, it is called this? Key Takeaways. In economics, leakage refers to capital or income that diverges from some kind of iterative system. Leakage is usually used in relation to a particular depiction of the flow of income within a system, referred to as the circular flow of income and expenditure, in the Keynesian model of economics.

Why does division of labor make international trade profitable? Countries can learn to create products that they are inefficient at producing. Workers always benefit when their labor is divided. Why does division of labor make international trade profitable? The countries that are most efficient at producing particular products produce them.

How does specialization facilitate trade between individuals and nations? When a nation takes advantage of specialization it will concentrate its human resources, capital, money, and time in producing a good or service they are best at. That nation can take advantage of this by entering into trade with another nation that is doing the same so they can increase output.

How do societies that specialize in producing certain goods obtain the other goods that they need? Trade enables sellers to specialize in the production of the good or service for which they have a comparative advantage. Through trade, the goods and services for which they do not have a comparative advantage in producing can be obtained from others who do.

What was the first two-party system? It featured two national parties competing for control of the presidency, Congress, and the states: the Federalist Party, created largely by Alexander Hamilton, and the rival Jeffersonian Democratic-Republican Party, formed by Thomas Jefferson and James Madison, usually called at the time the Republican Party (which is ...

What was the second party system and what were the two parties? One was the Democratic Party, led by Andrew Jackson. The other was the Whig Party, started by Henry Clay. The Whig party was made up of members of the National Republican Party and other people who opposed Jackson. There were also a number of important minor parties.

What is the third party Quizlet? third party. in the US, any party other than one of the two major parties (Republican and Democratic) is considered a minor party, or third party.

Why did framers fear political parties? The founders had seen vicious fighting among political interests in Europe, and wanted to avoid this in the new nation. As

the framers of the Constitution, they were very concerned about not creating crippling dissension within our political system.

Thermodynamics Problem and Solution: Mutinyore

Problem:

Mutinyore is a closed system that initially contains 2 moles of an ideal gas at a temperature of 300 K and a pressure of 1 atm. The gas is then heated reversibly to a temperature of 600 K. Calculate the change in entropy of the gas.

Solution:

For an ideal gas, the change in entropy during a reversible isothermal process is given by:

$$\Delta S = nR \ln(V_2/V_1)$$

where n is the number of moles of gas, R is the gas constant, and V_1 and V_2 are the initial and final volumes.

Since the system is closed, the volume remains constant. Therefore, the change in entropy is:

$$\Delta S = 2 * 8.314 \text{ J/(mol K)} * \ln(1) = 0 \text{ J/K}$$

Question:

What if the gas were not heated reversibly? Would the change in entropy be the same?

Answer:

No. For a non-reversible process, the change in entropy is greater than the change in entropy for a reversible process. This is because entropy is a measure of disorder, and non-reversible processes always increase the disorder of the system.

Question:

How could the gas be heated irreversibly?

Answer:

One way to heat the gas irreversibly would be to heat it with a flame. This would cause the gas to expand rapidly and create turbulence, which would increase the disorder of the system.

Question:

What is the efficiency of the reversible heating process?

Answer:

The efficiency of a reversible process is given by:

$$\eta = 1 - T_1/T_2$$

where T_1 and T_2 are the initial and final temperatures. In this case, the efficiency is:

$$\eta = 1 - 300 \text{ K} / 600 \text{ K} = 50\%$$

Question:

What is the maximum amount of work that could be extracted from the system during the reversible heating process?

Answer:

The maximum amount of work that could be extracted from the system is given by:

$$W = nRT \ln(T_2/T_1)$$

In this case, the maximum amount of work is:

$$W = 2 * 8.314 \text{ J/(mol K)} * (600 \text{ K} - 300 \text{ K}) = 4990 \text{ J}$$

What happens in Life Itself? Life Itself is a generation-spanning story about love and loss that begins by following Will (Oscar Isaac) a screenwriter spiraling after his pregnant wife, Abby (Olivia Wilde), leaves him. His struggles affect his daughter Dylan (Olivia Cooke), who grows into a troubled young woman in New York City.
