**What is the answer to the question food chain and food web?** Each living thing is a part of multiple food chains – for example, grass is a part of the food chain: grass ? grasshopper ? frog ? snake ? eagle, and also of the food chain: grass ? deer ? tiger. All of the interconnected and overlapping food chains in a habitat make up a food web.

**What are the ecological pyramids from food webs and food chains?** The food pyramid is an ecological hierarchy of food interactions in which the apex predator is at the top, each level preys on the next lower level, and the bottom level is generally green vegetation. Energy is transferred from one trophic level to another in the ecosystem and loses some amount at each trophic level.

**What happens to the number of organisms as you move up an ecological pyramid?** The number of organisms at each level decreases relative to the level below because there is less energy available to support those organisms. The top level of an energy pyramid has the fewest organisms because it has the least amount of energy.

**What is the first level of all food pyramids \_\_\_\_\_?** The first and lowest level contains the producers, green plants. The plants or their products are consumed by the second-level organisms—the herbivores, or plant eaters. At the third level, primary carnivores, or meat eaters, eat the herbivores; and at the fourth level, secondary carnivores eat the primary carnivores.

**What is a food chain answers?** The food chain is a linear sequence of organisms where nutrients and energy is transferred from one organism to the other. This occurs when one organism consumes another organism. It begins with the producer organism, follows the chain and ends with the decomposer organism.

**What is the simple answer to the food web?** A food web consists of all the food chains in a single ecosystem. Each living thing in an ecosystem is part of multiple

food chains. Each food chain is one possible path that energy and nutrients may take as they move through the ecosystem.

**What are examples of ecological pyramid?** Ecological Pyramid Examples The trees, grass, and other plants are producers and form the bottom layer of the pyramid. The producers include herbivores, such as hares, rodents, or deer. These organisms are eaten by secondary consumers that make up the next level of the pyramid, such as foxes.

**What is ecological pyramid or food pyramid?** Ecological pyramid definition – It is a graphic representation of the relationship between organisms at various trophic levels in a food chain. The basis of an ecological pyramid is biomass, energy, and number. Just as the name suggests, ecological pyramids are in the shape of a pyramid.

**What are the three types of food web pyramids?** Ecological pyramids show the relative amount of energy or matter contained within each trophic level in a given food chain or food web. There are three different types of ecological pyramids: pyramids of energy, pyramids of biomass, and pyramids of numbers.

**What is an example of a food chain with four trophic levels?** Grass (Producer) ?Grasshopper (Primary consumer) ?Rat (Secondary consumer) ?Owl (Tertiary consumer)

**What is an example of a food web?** Food web interactions For example, squirrels eat a variety of foods, including nuts, fruits, seeds, fungi, and insects. Similarly, squirrels are prey for not only foxes but also hawks, owls, and other predators.

**What are the 5 trophic levels of the food chain?** In a system with five trophic levels, organisms are classified on their pattern of subsistence. The five levels include: primary producers (plants), primary consumers (herbivores), secondary consumers, tertiary consumers, and detritivores (decomposers).

**How to explain the food pyramid?** The Food Pyramid is a visual representation of how different foods and drinks contribute towards a healthy balanced diet. The Food Pyramid allows individuals the flexibility to choose foods and drinks from each shelf depending on their food preferences.

**What are the 4 food groups in the pyramid?** Grains and cereals formed the base of the pyramid, fruits and vegetables formed the next layer followed by dairy and meat, beans, and nuts, and the tip of the pyramid included fats, oils and sweets to be used sparingly.

**Why is the food pyramid in question?** The pyramid also lacked differentiation within the protein-rich group ("Meat, Poultry, Fish, Dry Beans, Eggs, and Nuts"). The development of the US food pyramid has been influenced by food lobbyists undermining its credibility.

**How is energy transferred between organisms in an ecosystem?** Energy is transferred between organisms in food webs from producers to consumers. The energy is used by organisms to carry out complex tasks. The vast majority of energy that exists in food webs originates from the sun and is converted (transformed) into chemical energy by the process of photosynthesis in plants.

**What living things are decomposers?** Decomposers (fungi, bacteria, invertebrates such as worms and insects) have the ability to break down dead organisms into smaller particles and create new compounds. We use decomposers to restore the natural nutrient cycle through controlled composting.

**Why is the flow of energy in an ecosystem unidirectional?** The flow of energy in the ecosystem is unidirectional because the energy lost as heat from the living organisms of a food chain cannot be reused by plants in photosynthesis. During the transfer of energy through successive trophic levels in an ecosystem, there is a loss of energy all along the path.

**What animal is at the top of the food chain?** The highest level, known as quaternary consumers, is reserved for apex predators like polar bears or orcas who do not have natural predators within their typical habitat. This doesn't mean, however, that an apex predator might not be consumed by another.

**What are 5 food chain examples?** An example of a food chain could begin with algae, which is eaten by small fish, which is eaten by larger fish, which is eaten by a crane, which is eaten by a hawk. Another example starts with grass, which is eaten by a grasshopper, which is eaten by a frog, which is eaten by a snake, which is

eaten by a hawk.

**What do we call every stage in a food chain?** Trophic Levels. Organisms in food chains are grouped into categories called trophic levels. Roughly speaking, these levels are divided into producers (first trophic level), consumers (second, third, and fourth trophic levels), and decomposers.

**What is the difference between a food chain and a food web answer?** A food chain outlines who eats whom. A food web is all of the food chains in an ecosystem. Each organism in an ecosystem occupies a specific trophic level or position in the food chain or web. Producers, who make their own food using photosynthesis or chemosynthesis, make up the bottom of the trophic pyramid.

**What travels through a food chain or web answer?** A food chain describes how energy and nutrients move through an ecosystem. At the basic level there are plants that produce the energy, then it moves up to higher-level organisms like herbivores. After that when carnivores eat the herbivores, energy is transferred from one to the other.

**What are some questions about food chains?**

**What is an example of a food web or food chain?** An example of a food web is a deciduous forest ecosystem. In the deciduous forest, plants like grass are producers. They are eaten by primary consumers, such as rabbits, which are eaten by secondary consumers, such as foxes. The tertiary consumer in this food web could be a hawk or other large predator.
