**The Skeletal System: Questions and Answers****1. What is the function of the skeletal system?**

The skeletal system provides support, protection, movement, and mineral storage for the body. It consists of bones, cartilage, and ligaments. Bones are hard, mineralized tissue that forms the framework of the body. Cartilage is a flexible, supportive tissue that cushions and connects bones. Ligaments are tough, fibrous cords that hold bones together at joints.

**2. What are the different types of bones?**

---

There are five main types of bones: long bones, short bones, flat bones, irregular bones, and sesamoid bones. Long bones are longer than they are wide and include the bones of the arms and legs. Short bones are about as long as they are wide and include the bones of the wrist and ankle. Flat bones are thin and flat and include the bones of the skull and ribs. Irregular bones have a complex shape and include the bones of the vertebrae and pelvis. Sesamoid bones are small, round bones that are embedded in tendons and help to protect them.

### **3. What is the process of ossification?**

Ossification is the process by which cartilage is replaced by bone. It begins in the womb and continues until early adulthood. During ossification, cells called osteoblasts lay down new bone tissue, while cells called osteoclasts break down old bone tissue.

### **4. What are the functions of the joints?**

Joints are the points where two or more bones meet. They allow for movement and provide stability. There are many different types of joints, including hinge joints, ball-and-socket joints, and gliding joints.

### **5. What are some common skeletal disorders?**

Some common skeletal disorders include osteoporosis, arthritis, and fractures. Osteoporosis is a condition in which the bones become weak and brittle. Arthritis is a condition that causes inflammation of the joints. Fractures are breaks in the bones.
