Spread Moored or Turret Moored FPSOs for Deepwater Fields

Introduction Floating production storage and offloading vessels (FPSOs) are commonly used in deepwater oil and gas field developments. They provide a cost-effective and efficient way to process and store hydrocarbons while allowing for flexibility in field layout and production operations. Two main types of mooring systems are used for FPSOs: spread moored and turret moored.

Spread Moored FPSOs Spread moored FPSOs are held in place by a system of multiple anchors and chains spread out in a circular pattern around the vessel. This mooring system is typically used in water depths of less than 1,500 meters and provides excellent stability and redundancy. However, it can be complex and expensive to install and maintain, and it limits the vessel's ability to weathervane into the prevailing wind and current.

Turret Moored FPSOs Turret moored FPSOs are held in place by a single point mooring system consisting of a turret or swivel at the bow of the vessel and a turret yoke or chain connected to the seabed. This mooring system allows the FPSO to

rotate freely around the turret, weathervaning into the prevailing wind and current. Turret moored FPSOs are generally used in water depths greater than 1,500 meters and offer greater operability and flexibility. However, they can be more expensive to build and install than spread moored FPSOs.

Comparison of Spread Moored and Turret Moored FPSOs

1. Water Depth:

- Spread moored FPSOs: Water depths less than 1,500 meters
- Turret moored FPSOs: Water depths greater than 1,500 meters

2. Stability and Redundancy:

- Spread moored FPSOs: Higher stability and redundancy due to multiple anchors
- Turret moored FPSOs: Less stability due to a single point mooring system

3. Operability and Flexibility:

- Spread moored FPSOs: Limited operability due to fixed mooring pattern
- Turret moored FPSOs: Greater operability and flexibility due to weathervaning capability

4. Installation and Maintenance Cost:

- Spread moored FPSOs: Lower installation and maintenance cost
- Turret moored FPSOs: Higher installation and maintenance cost

5. Vessel Size and Capacity:

- Spread moored FPSOs: Can accommodate larger vessels with higher storage capacity
- Turret moored FPSOs: Typically smaller in size and capacity

Conclusion The choice between spread moored and turret moored FPSOs depends on the specific requirements and conditions of the deepwater field being developed. Spread moored FPSOs offer stability, redundancy, and lower installation costs, while

turret moored FPSOs provide greater operability, flexibility, and are suitable for deeper water depths.
