Q: How can missing data be handled? A: There are several methods for handling missing data, such as:

- **Case deletion:** Excluding observations with missing values.
- **Imputation:** Estimating missing values using statistical methods.
- **Multiple imputation:** Creating multiple imputed datasets and combining their results.
- **Weighting:** Adjusting the analysis to account for missing values.

Q: What factors should be considered when choosing a missing data handling method? A: Factors to consider include:

- The amount and pattern of missing data.
- The underlying assumptions of the statistical method being used.
- The potential impact of the missing data on the analysis results.

Q: What are the strengths and limitations of different missing data handling methods? A: Case deletion is simple but can reduce the sample size significantly. Imputation can introduce bias, but it allows for the retention of more data. Multiple imputation provides more accurate estimates but is more computationally intensive. Weighting adjusts for missing values but assumes that the missing data is missing at random.
