What is fertigation and nutrient management in greenhouse? Fertigation is a precise, controlled and tested method of applying fertilisers, nutrients and other water-soluble products through drip lines and sometimes by micro- sprinkler irrigation systems as per crop requirements, its stage, canopy size, soil or season, etc.

What is a fertigation system for hydroponics? A Drip Fertigation System feeds a liquid nutrient solution to the plants in the exact proportions they require. The systems can be fed via a batched dosing tank or an inline injection system. This ensures the exact nutrient strength and pH level is attained before it is fed to the crop.

Which fertilizer is best for fertigation? Fertilizer used in fertigation Special fertilisers like mono ammonium phosphate (Nitrogen and Phosphorus), poly feed (Nitrogen, Phosphorus and Potassium), Multi K (Nitrogen and Potassium), Potassium sulphate (Potassium and Sulphur) are highly suitable for fertigation as they are highly soluble in water.

What is fertigation of nutrients? 'Fertigation' is the technique of supplying dissolved fertiliser to crops through an irrigation system. When combined with an efficient irrigation system both nutrients and water can be manipulated and managed to obtain the maximum possible yield of marketable production from a given quantity of these inputs.

What is the best method of feeding plants in a greenhouse? Maintaining adequate nutrition is among the most critical aspects of producing greenhouse crops. At present most growers utilize a liquid feed program as their primary means of supplying plant nutrients. This program may also be supplemented with granular or slow release fertilizers added to the growing medium.

What is the difference between fertigation and fertilizers? Fertigation is the application of fertilizers through irrigation system and is the most advanced and efficient practice of fertilization. Drip system is the most adopted and effective way of fertigation for efficient use of fertilizer and irrigation water.

What is the most reliable method of watering greenhouse plants? Drip irrigation is generally considered the most efficient greenhouse watering system. Through this method, water is delivered slowly and accurately to growing media, ensuring crops get water supplied directly to their root zone.

Statistics Practice Test 2: Candy Company

Questions:

1. A candy company claims that its chocolate bar contains an average of 10 ounces of chocolate. A sample of 36 bars is taken and tested, yielding an average weight of 10.2 ounces and a sample standard deviation of 1.2 ounces. Test the company's claim at a significance level of 0.05.
2. The company also claims that the number of pieces of candy in a bag follows a normal distribution with a mean of 50 and a standard deviation of 8. A sample of 50 bags is taken, and the average number of pieces is found to be 48. Test the company's claim at a significance level of 0.01.
3. The company decides to conduct a survey to estimate the proportion of customers who prefer its chocolate bar over its competitor's bar. A sample of 200 customers is taken, and 120 of them prefer the company's bar. Construct a 95% confidence interval for the proportion of customers who prefer its bar.

Answers:

Question 1:

- Null hypothesis: $H_0: \mu = 10$
- Alternative hypothesis: $H_a: \mu \neq 10$
- Test statistic: $z = (10.2 - 10) / (1.2 / \sqrt{36}) = 1.5$
- P-value: $2 * P(Z < -1.5) = 0.1336$
- Conclusion: Since the p-value is greater than the significance level of 0.05, we fail to reject the null hypothesis. There is not enough evidence to conclude that the company's claim is false.

Question 2:

- Null hypothesis: $H_0: \mu = 50$
- Alternative hypothesis: $H_a: \mu \neq 50$
- Test statistic: $z = (48 - 50) / (8 / \sqrt{50}) = -2.5$
- P-value: $2 * P(Z < -2.5) = 0.0118$
- Conclusion: Since the p-value is less than the significance level of 0.01, we reject the null hypothesis. There is sufficient evidence to conclude that the company's claim is false.

Question 3:

- Sample proportion: $p = 120 / 200 = 0.6$
- 95% confidence interval: $0.6 \pm 1.96 \sqrt{0.6 \cdot 0.4 / 200} = (0.54, 0.66)$
- Conclusion: We are 95% confident that the proportion of customers who prefer the company's bar over its competitor's bar is between 0.54 and 0.66.
