1. What is the Solar System?

The Solar System is a gravitationally bound system consisting of the Sun, planets, dwarf planets, and other celestial bodies orbiting around the Sun. The planets include Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Dwarf planets are smaller than planets and do not clear their orbits of other objects.

2. How Old is the Universe?

Scientists estimate the age of the universe to be approximately 13.8 billion years. This determination is based on measurements of the cosmic microwave background

radiation and the expansion rate of the universe.

3. What is a Black Hole?

A black hole is a region of spacetime where gravity is so strong that not even light can escape. Black holes form when massive stars collapse at the end of their lifespan. They are characterized by their immense gravitational pull and the absence of visible light.

4. What is Dark Matter?

Dark matter is a hypothetical form of matter that does not emit or reflect any light. It is believed to account for approximately 27% of the universe's total mass-energy. Dark matter's existence is inferred from its gravitational effects on visible matter, such as galaxies and galaxy clusters.

5. What is the Future of the Universe?

The ultimate fate of the universe remains uncertain. Scientists propose several theories, including the Big Crunch, where the universe collapses back into itself; the Big Freeze, where the universe expands forever and eventually all energy is lost; and the Big Rip, where the expansion of the universe accelerates to the point where it tears apart all matter.
