1. What is the role of the cell membrane in a cell?

The cell membrane, also known as the plasma membrane, acts as a barrier between the cell interior and the outside environment. It regulates the movement of substances into and out of the cell, maintaining the cell's homeostasis.

2. What is the difference between passive and active transport?

Passive transport is the movement of molecules down a concentration gradient, without the need for energy. Active transport requires energy to move molecules against a concentration gradient, such as transporting ions into a cell.

3. What are the stages of mitosis?

Mitosis has four main stages:

- Prophase: Chromosomes condense and the nuclear envelope breaks down.
- Metaphase: Chromosomes align at the equator of the cell.
- Anaphase: Sister chromatids separate and move to opposite poles of the cell.
- Telophase: New nuclear envelopes form around the chromosomes, and cytokinesis divides the cytoplasm into two new daughter cells.

4. What is photosynthesis?

Photosynthesis is the process by which plants convert sunlight, carbon dioxide, and water into glucose and oxygen. This process is essential for the production of food and the release of oxygen into the atmosphere.

5. What is the difference between genotype and phenotype?

Genotype refers to the genetic makeup of an organism, and phenotype refers to the observable traits that result from the expression of those genes. For example, a dog's genotype may determine its hair color, while its phenotype is its actual hair color.
