Tutorial: How to Build a GraphQL Server with Apollo GraphQL

1. What is GraphQL? GraphQL is a query language for APIs that allows clients to request specific data from a server. It is an alternative to REST APIs and offers several advantages, such as improved performance, reduced data duplication, and increased flexibility.

2. What is Apollo GraphQL? Apollo GraphQL is a popular open-source framework for building GraphQL servers and clients. It provides a set of tools and libraries that simplify the development process, including a server library, a client library, and a playground for testing queries.

3. How to Install Apollo GraphQL

To install Apollo GraphQL, use the following command in your terminal:

```
npm install apollo-server
```

4. How to Create a GraphQL Schema

A GraphQL schema defines the types of data that can be queried from the server. To create a schema, use the following syntax:

```
const schema = new GraphQLSchema({
  query: new GraphQLObjectType({
    name: 'Query',
    fields: {
      getTodos: {
        type: new GraphQLList(GraphQLString),
        resolve: () => ['Task 1', 'Task 2'],
      },
    },
  }),
});
```

5. How to Start a GraphQL Server

To start a GraphQL server, use the following code:

```
const { ApolloServer, gql } = require('apollo-server');
const schema = gql`...`;

const server = new ApolloServer({
  schema,
});

server.listen().then(({ url }) => {
  console.log(`Server running at ${url}`);
});
```
