

Arc routing problems methods and applications

[Download Complete File](#)

What is the capacitated arc routing problem? In mathematics, the capacitated arc routing problem (CARP) is that of finding the shortest tour with a minimum graph/travel distance of a mixed graph with undirected edges and directed arcs given capacity constraints for objects that move along the graph that represent snow-plowers, street sweeping machines, or winter ...

How do you fix a capacitated vehicle routing problem? The aim of clustering analysis to solve CVRP is to separate this problem into several subproblems and use the optimization algorithm to solve these subproblems. Then, based on the optimal solutions of these subproblems, we can get the optimal solution of the main problem.

What is the periodic arc routing problem? The problem consists of determining a set of routes to cover a given network over a time horizon. The roads must be serviced a number of times in sub-periods over the time horizon, according to a hierarchy of arc classes. We present a mathematical model and a heuristic solution approach.
