Tension, Compression, Shear, Bending, and Torsion: Key Features

Q1: What is tension? A1: Tension is a force that pulls an object apart, causing elongation. The object experiences internal forces that resist this pull, resulting in stress.

Q2: What is compression? A2: Compression is a force that pushes an object together, causing it to shorten. The object resists this force, creating internal compressive stress.

Q3: What is shear? A3: Shear is a force that acts parallel to the surface of an object, causing it to slide in one direction relative to another. The object develops shear stress to resist this force.

Q4: What is bending? A4: Bending is a force that causes an object to curve or deform without breaking. The object experiences both tensile and compressive stresses along its length, depending on the direction of the force.

Q5: What is torsion? A5: Torsion is a force that causes an object to twist or rotate around its axis. The object undergoes shear stress as one surface slides past another due to the applied force.

Additional Features:

- **Stress:** The internal force per unit area that resists applied loads.
- **Strain:** The deformation or change in an object's size or shape due to applied forces.
- **Elasticity:** The property of an object to return to its original shape after the applied force is removed.

- **Plasticity:** The property of an object to permanently deform under applied forces.
- **Yield strength:** The maximum stress an object can withstand before becoming plastic.
- **Ultimate strength:** The maximum stress an object can withstand before failure.
