#### Soil Mechanics and Foundation Engineering: Q&A

#### By Dr. B. M. Arora, PCOTOTS

- **1. What is Soil Mechanics?** Soil mechanics is the study of the behavior of soil as an engineering material. It includes the study of soil properties, soil classification, and the application of soil mechanics principles to the design of foundations and other earth structures.
- 2. What are the Types of Soil? Soils can be classified into two main categories: cohesive and non-cohesive. Cohesive soils are those that contain particles that stick together, such as clay. Non-cohesive soils are those that do not contain particles that stick together, such as sand.
- **3. What are the Properties of Soil?** The properties of soil that are important for foundation engineering include:
  - Unit weight
  - Specific gravity

- Grain size distribution
- Porosity
- Void ratio
- Shear strength
- Compressibility
- **4. What is the Purpose of Foundation Engineering?** Foundation engineering is the application of soil mechanics principles to the design and construction of foundations for structures. The purpose of foundation engineering is to ensure that the foundation is able to support the structure without experiencing excessive settlement or failure.
- **5. What are the Types of Foundations?** There are many different types of foundations, but the most common ones include:
  - Shallow foundations
  - Deep foundations
  - Pile foundations

#### Conclusion
