What subject is classical mythology? This course is an examination of the meaning, form and function of Greek and Roman mythology especially its transmission via the literature, art and material culture of the ancient Mediterranean world.

Is classical mythology a social science? While the classification of mythology has changed over time, today it is neither history nor science. Mythology is generally understood today as fiction, stories made up by people to explain realities.

Is Greek mythology older than the Bible? Answer and Explanation: Yes, Greek and Roman mythology formed long before Christianity. Christianity first developed in the 1st century AD. Greek mythology predates this time period by well over 1,000 years.

Why is classical mythology so popular? Greek myths have themes that are common to us and the ancient Greeks. These themes include power, loss and love.

Madeline Miller's The Song of Achilles shows how what we might consider more modern have always been within the ancient tales that have helped shape our society.

Did Christianity copy Greek mythology? Greek mythology exerted a notable influence on the early development of Christianity. Here are some ways in which this influence can be observed: First, Greek mythology explored concepts such as creation, divine intervention, heroism, and the interactions between gods and humans.

What is photosynthesis question answers? Photosynthesis is the process by which green plants prepare their own food from carbon dioxide and water by using sunlight energy in the presence of chlorophyll.

What is photosynthesis in biology worksheet? Photosynthesis Worksheet. Photosynthesis is a process in which sunlight energy is used to make glucose. The site of photosynthesis is in the chloroplast – an organelle found in the leaves of green plants. The main functions of chloroplasts are to produce food (glucose) during photosynthesis, and to store food energy.

What is photosynthesis in biology PDF? Photosynthesis is the process by which plants, some bacteria and some protistans use the energy from sunlight to produce glucose from carbon dioxide and water. This glucose can be converted into pyruvate which releases adenosine triphosphate (ATP) by cellular respiration. Oxygen is also formed.

What is a good question for photosynthesis? Question: What is the main source of energy for photosynthesis? Answer: Photosynthesis relies on light energy from the sun to drive the series of chemical reactions between carbon dioxide and water, ultimately producing glucose and oxygen. Question: What is the chemical equation

for photosynthesis?

What is photosynthesis A level answer? ?What is Photosynthesis? Photosynthesis is the process by which plants, algae, and some bacteria convert light energy from the sun into chemical energy in the form of glucose, which is a type of sugar. This process also releases oxygen gas into the air. ?Why is Photosynthesis Important?

Is photosynthesis a very short answer? Photosynthesis is the process by which plants and other things make food. It is an endothermic (takes in heat) chemical process that uses sunlight to turn carbon dioxide into sugars that the cell can use as energy. As well as plants, many kinds of algae, protists and bacteria use it to get food.

What is the photosynthesis answer key? Photosynthesis is the process by which plants use sunlight, water, and carbon dioxide to create oxygen and energy in the form of sugar.

What is the photosynthesis quizlet? Photosynthesis is the process by which photoautotrophic organisms convert light energy (usually from the Sun) into chemical energy (glucose). The photosynthetic process uses light energy to produce glucose from water and carbon dioxide, releasing oxygen gas as a byproduct.

What is photosynthesis in biology formula? The chemical equation for photosynthesis is 6CO2+6H2O?C6H12O6+6O2. 6CO2+6H2O?C6H12O6+6O2. In plants, the process of photosynthesis takes place in the mesophyll of the leaves, inside the chloroplasts. Chloroplasts contain disc-shaped structures called thylakoids, which contain the pigment chlorophyll.

Why is photosynthesis biology? Photosynthesis is essential to all life on earth; both plants and animals depend on it. It is the only biological process that can capture energy that originates in outer space (sunlight) and convert it into chemical compounds (carbohydrates) that every organism uses to power its metabolism.

What is photosynthesis in biology terms? A chemical process that occurs in plants, algae, and some types of bacteria, when they are exposed to sunlight. During photosynthesis, water and carbon dioxide combine to form carbohydrates (sugars)

and give off oxygen.

What is photosynthesis in a simple way? The process by which plants make their own food using chlorophyll, carbon dioxide, and water in the presence of sunlight is known as photosynthesis. Chlorophyll is a green pigment present in the leaves of plants. This pigment captures the sun's energy, which is used to prepare food from carbon dioxide and water.

What is the photosynthesis question answer? Photosynthesis is the process by which green plants and certain other organisms transform light energy into chemical energy. During photosynthesis in green plants, light energy is captured and used to convert water, carbon dioxide, and minerals into oxygen and energy-rich organic compounds.

What are the 3 things needed for photosynthesis? This process is called photosynthesis and is performed by all plants, algae, and even some microorganisms. To perform photosynthesis, plants need three things: carbon dioxide, water, and sunlight.

What 3 things happen during photosynthesis? The three episodes that occur during the photosynthesis cycle are: Light energy is absorbed by chlorophyll, which breaks down water molecules into oxygen and hydrogen. Light energy is converted into chemical energy. The reduction of carbon dioxide leads to the formation of carbohydrates.

What are the two stages of photosynthesis?

What is the function of ATP in photosynthesis? ATP can be used to store energy for future reactions or be withdrawn to pay for reactions when energy is required by the cell. Animals store the energy obtained from the breakdown of food as ATP. Likewise, plants capture and store the energy they derive from light during photosynthesis in ATP molecules.

What gas is produced by photosynthesis? Plants, during the process of photosynthesis, take up carbon dioxide from the atmosphere and use sunlight along with it to make their food. The gas produced as a result of photosynthesis is oxygen.

What are the two products of photosynthesis? The products of photosynthesis are glucose and oxygen. Oxygen passes out of the leaves through the stomata.

What is produced in photosynthesis? During the process of photosynthesis, cells use carbon dioxide and energy from the Sun to make sugar molecules and oxygen. These sugar molecules are the basis for more complex molecules made by the photosynthetic cell, such as glucose.

Why is it called photosynthesis? The process is called photosynthesis because plants use light, or photo, from the sun to make, or synthesize, their chemical food energy. As you already know, photosynthesis is the term for the process that plants use to make their food energy. They do this by converting sunlight into chemical energy.

What is the simple definition of photosynthesis? (FOH-toh-SIN-theh-sis) A chemical process that occurs in plants, algae, and some types of bacteria, when they are exposed to sunlight. During photosynthesis, water and carbon dioxide combine to form carbohydrates (sugars) and give off oxygen. Photosynthesis is needed for animal and plant life.

What is the photosynthesis quizlet? Photosynthesis is the process by which photoautotrophic organisms convert light energy (usually from the Sun) into chemical energy (glucose). The photosynthetic process uses light energy to produce glucose from water and carbon dioxide, releasing oxygen gas as a byproduct.

What is the answer to the one word question of photosynthesis? The correct answer is chemical. Photosynthesis in plants converts light energy to chemical energy. Photosynthesis is the process by which green plants produce carbohydrates by absorbing carbon dioxide, water, and sunlight in the presence of chloroplast and liberate chemical energy.

What is photosynthesis 5th grade? is the process in which green plants use sunlight to make their own food. Photosynthesis is necessary for life on Earth. Without it there would be no green plants, and without green plants there would be no animals. Photosynthesis requires sunlight, chlorophyll, water, and carbon dioxide gas.
