Types of Reactions Lab Answers: Chemistry 11

**Question 1:** What are the different types of chemical reactions?

**Answer:** The main types of chemical reactions are:

• **Combination reactions:** Two or more substances combine to form a single product.

 Decomposition reactions: A single substance breaks down into two or more products.

 Single replacement reactions: One element replaces another element in a compound.

 Double replacement reactions: Two compounds exchange ions to form two new compounds.

**Question 2:** What are the reactants and products in a combination reaction?

**Answer:** The reactants in a combination reaction are the two substances that are combining, while the product is the single substance that is formed. For example, in the reaction between hydrogen and oxygen to form water, hydrogen and oxygen are the reactants and water is the product.

**Question 3:** What is the balanced chemical equation for the decomposition of water?

**Answer:** The balanced chemical equation for the decomposition of water is:

2H<sub>2</sub>0 ? 2H<sub>2</sub> + 0<sub>2</sub>

**Question 4:** What is the difference between a single replacement reaction and a double replacement reaction?

**Answer:** In a single replacement reaction, one element replaces another element in a compound, while in a double replacement reaction, two compounds exchange ions to form two new compounds. For example, in the reaction between iron and copper sulfate, iron replaces copper in the compound, forming iron sulfate and copper. In contrast, in the reaction between sodium chloride and silver nitrate, the sodium and silver ions exchange places, forming sodium nitrate and silver chloride.

**Question 5:** What are the applications of different types of chemical reactions?
