When Did She Die? Lab Answer Key (KSCAFF)

Objective: To determine the time of death based on body temperature and elapsed time.

Materials:

- Thermometer
- Stopwatch
- Body (provided by instructor)

Procedure:

- 1. Insert the thermometer into the body's rectum.
- 2. Record the initial temperature and the time.
- 3. Wait 15 minutes and record the temperature and time again.

Calculations:

- **Elapsed Time:** Determine the elapsed time between the initial and second temperature readings.
- **Cooling Rate:** Calculate the cooling rate by subtracting the second temperature from the initial temperature and dividing by the elapsed time.
- Estimated Time of Death: Use the formula "Time of Death = (98.6 Rectal Temperature) / Cooling Rate"

Questions:

1. What is the initial rectal temperature?

Answer: Depends on the body provided

2. What is the rectal temperature after 15 minutes?

Answer: Depends on the body provided

3. What is the elapsed time between the two temperature readings?

o Answer: 15 minutes

4. What is the cooling rate?

Answer: (Second Temperature - Initial Temperature) / Elapsed Time

5. What is the estimated time of death?

 Answer: Depends on the rectal temperature, cooling rate, and formula used

Wireless Communications Design Handbook: Interference into Circuits

Q: What are the aspects of noise interference?

A: Noise interference arises from various sources such as thermal noise, shot noise, partition noise, and flicker noise. These sources generate unwanted signals that can degrade the performance of wireless communication systems by masking the desired signal.

Q: How does noise interfere with circuits?

A: Noise can enter circuits through various paths, including the antenna, power supply, and ground connections. It can disrupt the operation of amplifiers, oscillators,

and other circuit components by adding spurious signals and reducing the signal-to-

noise ratio (SNR).

Q: What are some environmental concerns related to wireless

communications?

A: Environmental concerns include electromagnetic interference (EMI), radio

frequency (RF) radiation, and thermal emissions. EMI can cause interference with

other electronic devices, while RF radiation can have health effects. Thermal

emissions from wireless devices can contribute to the heat island effect.

Q: How can interference be minimized in wireless communication systems?

A: Interference can be minimized through techniques such as frequency hopping

spread spectrum (FHSS), direct sequence spread spectrum (DSSS), and orthogonal

frequency division multiplexing (OFDM). These techniques spread the signal over a

wider bandwidth, making it less susceptible to interference.

Q: What are the best practices for mitigating interference?

A: To mitigate interference, designers should use shielded enclosures, provide

proper grounding, and implement filtering techniques. They should also carefully

select the operating frequency and antenna type, and consider using interference

cancellation algorithms. Additionally, it is important to adhere to regulatory standards

regarding EMI and RF emissions.
