System Software: Leland L. Beck, 3rd Edition

Q: What is system software? A: System software is a collection of programs that manage computer hardware and software resources and provide a platform for application software to run. It includes operating systems, utility programs, and device drivers.

Q: What are the key components of an operating system (OS)? A: The key components of an OS are the kernel, process scheduler, memory manager, file system, and input/output manager. The kernel is the core component that controls the allocation and use of resources.

Q: What are the main responsibilities of a process scheduler? A: The process scheduler allocates and deallocates time slices to processes, ensuring that all processes have a fair chance to execute. It also manages process priorities and handles task switching and inter-process communication.

Q: How does a memory manager work? A: The memory manager manages the physical and virtual memory space of a computer. It tracks which areas of memory are allocated to different processes and ensures that processes do not overwrite

each other's memory.

Q: What is the role of file systems in system software? A: File systems organize and store files on a computer's storage media. They provide a structured way to access and manage data, allowing users to create, delete, and modify files and folders.
