What is concurrency in SQL? Database concurrency is a unique characteristic enabling two or more users to retrieve information from the database at the same time without affecting data integrity.

Why do we need concurrency control in database? Concurrency Control ensures that simultaneous transactions on a DBMS do not interfere with each other. It also prevents common issues like dirty reads, lost updates, and non-repeatable reads. The key features include deadlock avoidance, ensuring serializability of transactions, and maintaining data integrity.

How to avoid concurrency in SQL? One of the easiest techniques to handle concurrency in SQL is by using Locking mechanism: Optimistic Locking: just lock the data before making any changes to it. Pessimistic Locking: keep a timestamped version of data to be changed.
