How do I receive data from UART? Inside the main function, we will first initialize the clock, and then initialize the UART. Then enable the global interrupt by calling the function sei(). Once the data is received in the receive buffer, the RXC (Receive Complete) interrupt will be triggered.

How do you communicate over UART? The transmitting UART is connected to a controlling data bus that sends data in a parallel form. From this, the data will now be transmitted on the transmission line (wire) serially, bit by bit, to the receiving UART. This, in turn, will convert the serial data into parallel for the receiving device.

How can a UART be utilized? UART is prevalent in various applications, ranging from microcontrollers and embedded systems to computer peripherals. At its core, UART enables the serial transmission of data, where bits are sent one after the other without a shared clock signal between the sender and the receiver.
