Semiconductor Devices: Physics and Technology (2nd Edition) Questions and Answers

1. Explain the difference between intrinsic and extrinsic semiconductors. Intrinsic semiconductors are pure semiconductors with no impurities, while extrinsic semiconductors have impurities added to modify their electrical properties. Extrinsic semiconductors can be either n-type (with electron-donating impurities) or p-type (with electron-accepting impurities).

2. Describe the working principle of a p-n junction diode. A p-n junction diode is a semiconductor device that consists of a p-type and n-type semiconductor material joined together. When forward-biased, the diode allows current to flow in one direction due to the injection of charge carriers across the junction. When reverse-biased, the diode blocks current flow due to the depletion region formed at the junction.

3. What are the advantages of metal-oxide-semiconductor (MOS) devices over bipolar junction transistors (BJTs)? MOS devices have several advantages over BJTs, including lower power consumption, higher switching speeds, and better scaling capabilities. MOS devices are also less sensitive to temperature and radiation than BJTs.

4. Explain the operation of a field-effect transistor (FET). A FET is a voltage-controlled semiconductor device that uses an electric field to modulate the flow of current between two terminals. There are two main types of FETs: junction field-

effect transistors (JFETs) and metal-oxide-semiconductor field-effect transistors (MOSFETs).

5. Describe the fundamental differences between silicon, germanium, and gallium arsenide as semiconductor materials. Silicon is the most commonly used semiconductor material due to its abundance, low cost, and well-established fabrication processes. Germanium has higher carrier mobility than silicon, but is more expensive and has a narrower bandgap. Gallium arsenide is a compound semiconductor with a wider bandgap and higher electron velocity than silicon or germanium, making it suitable for high-frequency and optoelectronic applications.
