The processes of acquiring an image of the area containing the text, preprocessing that image, extracting (segmenting) the individual characters, describing the characters in a form suitable for computer processing, and recognizing those individual characters are in the scope of what we call digital image processing.

What are the 3 types of digital image processing? There generally three types of processing that are applied to an image. These are: low-level, intermediate-level and high-level processing which are described below. Areas of Digital Image Processing (DIP): Starts with one image and produces a modified version of that image.

How to learn digital image processing?

What are the four types of digital images? The images types we will consider are: 1) binary, 2) gray-scale, 3) color, and 4) multispectral. Binary images are the simplest type of images and can take on two values, typically black and white, or 0 and 1. A binary image is referred to as a 1-bit image because it takes only 1 binary digit to represent each pixel.

What are the fundamentals of digital image processing? The basic operations performed in a digital image processing systems include (1) acquisition, (2) storage, (3) processing, (4) communication and (5) display. Color is the perceptual result of light in the visible region of the spectrum, having in the region of 400nm to 700nm, incident upon the retina.
