It provides users with dynamic arrays in Java that can grow automatically when users insert an element when there is no space left for an additional element.

What is the emptySet method in the collection framework? The emptySet() method of Java Collections class is used to get the Set that has no elements. These empty Set are immutable in nature.

Which collection is fastest in Java? As we can see, the default choice is the HashSet collection, as it's very fast for all the operations it supports. Furthermore, if also the insertion order of elements matters, we go with LinkedHashSet.

Which collections are fail fast in Java? Only the concurrent collections introduced in JDK 1.5, such as CopyOnWriteArrayList and CopyOnWriteArraySet, provide fail safe iteration, while the majority of JDK 1.4 collections, such as HashSet, Vector, and ArrayList, have fail-fast iterators.

How many methods are there in a collection in Java? Each of the six core collection interfaces — Collection, Set, List, Map, SortedSet, and SortedMap — has one static factory method. Each of these methods returns a synchronized (thread-safe) Collection backed up by the specified collection.

Which does not implement the collection interface? Map interface does not implement the Collection interface. It can only contain a unique key but can have duplicate elements. There are two interfaces which implement Map in java that are Map interface and Sorted Map.

What is the difference between an array and a collection? Arrays are fixed in size, whereas some Collections are grow-able in nature. Arrays store homogeneous data. Collections store both homogeneous as well as heterogeneous data. In Arrays, there are no underlining data structures, whereas Collections have underlining data structures.
