Using Symbolic Math Toolbox™, you can differentiate and integrate symbolic expressions, perform series expansions, find transforms of symbolic expressions, and perform vector calculus operations by using the listed functions. When modeling your problem, use assumptions to return the right results.

Is there a solver in MATLAB? Use auto solver. New models have their solver selection set to auto solver by default. Auto solver recommends a fixed-step or variable-step solver for your model as well as the maximum step size.

What is the command to solve an equation in MATLAB? Y = solve(eqns , vars) solves the system of equations eqns for the variables vars and returns a structure that contains the solutions. If you do not specify vars , solve uses symvar to find the variables to solve for. In this case, the number of variables that symvar finds is equal to the number of equations eqns .

A homogeneous material has a response that is independent of the specimen used during a mechanical loading experiment. Most traditional engineering materials (e.g., steel) can be considered homogeneous.
