How do forensic scientists who study explosions determine what an explosive was made of? After an explosion, residue from the explosive that was used will be left behind. To identify the type of explosive used, investigators may use an ion mobility spectrometer (IMS), a handheld chemical detection device, to identify residues that may be present around the blast site.

What methods are used to analyze evidence from explosions? For example, the combination of gas or liquid chromatography with mass spectrometry is considered sufficient analytical data to allow for the identification of many explosive chemical components.

Is forensics a lot of math? However, for degree paths like forensics science, math requirements will be higher.
