Signal Processing First Problem Solutions

1. What is the difference between analog and digital signals?

Analog signals are continuous in time and amplitude, while digital signals are discrete in both time and amplitude. Analog signals can represent a wide range of values, while digital signals can only represent a finite number of values.

2. What is the Fourier transform?

The Fourier transform is a mathematical operation that converts a signal from the time domain to the frequency domain. The frequency domain representation of a signal shows the distribution of power at different frequencies.

3. What is filtering?

Filtering is a signal processing technique that removes unwanted frequency components from a signal. Filters can be designed to pass only certain frequency bands, or to attenuate certain frequency bands.

4. What is noise?

Noise is unwanted random fluctuations in a signal. Noise can be caused by a variety of factors, such as thermal noise, shot noise, and quantization noise.

5. What is the Nyquist rate?

The Nyquist rate is the minimum sampling rate that must be used to avoid aliasing. Aliasing is a phenomenon that occurs when a signal is sampled at a rate that is too low, resulting in the appearance of spurious frequency components in the sampled signal.
