Solution of Fluid Mechanics: Douglas 5e

1. Question: How do you solve the Navier-Stokes equations for an incompressible, viscous fluid? **Answer:** The Navier-Stokes equations are a set of partial differential equations that describe the motion of fluids. For incompressible, viscous fluids, they can be solved using various numerical methods, such as the finite difference method, the finite volume method, or the finite element method.

2. Question: What is the boundary layer approximation and when is it valid? **Answer:** The boundary layer approximation is a simplification of the Navier-Stokes equations that assumes that the flow is primarily parallel to a solid surface. It is valid when the fluid is thin relative to the length scale of the surface, and when the viscous forces are dominant near the surface.

3. Question: How do you calculate the drag force on a sphere? **Answer:** The drag force on a sphere can be calculated using the drag coefficient, which depends on the Reynolds number. The drag coefficient can be found experimentally or numerically, and the drag force can then be calculated as the product of the drag coefficient, the fluid density, the sphere's diameter, and the square of the velocity.

4. Question: What is the difference between laminar and turbulent flow? **Answer:** Laminar flow is characterized by smooth, orderly motion, while turbulent flow is characterized by chaotic, unpredictable motion. The transition from laminar to turbulent flow occurs when the Reynolds number exceeds a critical value.

5. Question: How do you solve for the velocity profile in a pipe? **Answer:** The velocity profile in a pipe can be solved using the Hagen-Poiseuille equation for laminar flow or the Prandtl-Karman equation for turbulent flow. These equations relate the velocity to the pressure gradient, the pipe diameter, and the fluid viscosity.
