Question 1:

A 10 kg object is dropped from a height of 50 meters. What is its velocity just before it hits the ground?

Answer:

vf = sqrt(2gh) = sqrt(2*9.8*50) = 31.3 m/s*

Explanation:

The final velocity of an object dropped from a height can be calculated using the formula vf = sqrt(2gh), where g is the acceleration due to gravity and h is the height.

Question 2:

A force of 50 Newtons is applied to an object with a mass of 5 kg. What is the object's acceleration?

Answer:

$a = F/m$ = 50 N / 5 kg = 10 m/s^2*

Explanation:

According to Newton's second law, the acceleration of an object is directly proportional to the force applied and inversely proportional to its mass.

Question 3:

A projectile is launched horizontally at a speed of 20 m/s. Its initial height above the ground is 10 meters. What is its horizontal displacement when it hits the ground?

Answer:

$x = vt = 20 m/s$ sqrt(2*10 m / 9.8 m/s^2) = 41.0 m

Explanation:

To calculate the horizontal displacement, we need to determine the time it takes for the projectile to fall to the ground. We can use the formula t = sqrt(2h/g) to find this time.

Question 4:

A charged particle is moving in a magnetic field. The magnetic field is perpendicular to the particle's velocity. What is the path of the particle?

Answer:

The particle will move in a circle.

Explanation:

A charged particle moving in a magnetic field experiences a force perpendicular to both its velocity and the magnetic field. This force causes the particle to move in a

circular path.

Question 5:

A simple pendulum has a length of 1 meter. What is the period of oscillation?

Answer:

$T = 2\text{pi}\,sqrt(L/g) = 2pi\,\text{sqrt}(1 \text{ m} / 9.8 \text{ m/s}^2) = 2.01 \text{ s}*$

Explanation:

The period of oscillation for a simple pendulum is given by the formula $T = 2pi$ sqrt(L/g), where L is the length of the pendulum and g is the acceleration due to gravity.
