Question 1:

Calculate the contribution margin ratio for a product that has a selling price of $100 per unit, variable costs of $50 per unit, and fixed costs of $10,000.

Answer:

Contribution margin ratio = (Selling price per unit - Variable cost per unit) / Selling price per unit = ($100 - $50) / $100 = 50%

Question 2:

What is the break-even point in units for a company that has fixed costs of $100,000, a contribution margin per unit of $20, and a selling price per unit of $50?

Answer:

Break-even point = Fixed costs / Contribution margin per unit = $100,000 / $20 = 5,000 units

Question 3:

A company is considering two projects. Project A requires an initial investment of $10,000 and is expected to generate cash flows of $2,000, $3,000, and $4,000 in years 1, 2, and 3, respectively. Project B requires an initial investment of $15,000 and is expected to generate cash flows of $4,000, $5,000, and $6,000 in years 1, 2, and 3, respectively. Which project is more profitable based on the net present value (NPV) method, assuming a discount rate of 10%?

Answer:

Project A:

NPV = -$10,000 + $2,000/(1.10)^1 + $3,000/(1.10)^2 + $4,000/(1.10)^3 = -$10,000 + $1,818.18 + $2,592.59 + $3,207.73 = $1,618.50

Project B:

NPV = -$15,000 + $4,000/(1.10)^1 + $5,000/(1.10)^2 + $6,000/(1.10)^3 = -$15,000 + $3,636.36 + $4,118.83 + $4,730.77 = -$2,454.04

Project A has a higher NPV than Project B, indicating that it is the more profitable project.

Question 4:

A company has a current ratio of 2.0 and a quick ratio of 1.5. What is the company's acid-test ratio?

Answer:

Acid-test ratio = (Current assets - Inventory) / Current liabilities = (2.0 * Total assets - Inventory) / Total liabilities

Since we don't have the actual values of total assets and inventory, we cannot calculate the acid-test ratio.

Question 5:

A company's return on assets (ROA) is 10%. The company's debt-to-equity ratio is 1.5. What is the company's return on equity (ROE)?

Answer:

ROE = ROA / (1 - Debt-to-equity ratio) = 10% / (1 - 1.5) = 20%

What is Linux performance tuning? Tuned is a Linux feature that monitors a system and optimizes its performance under certain workloads. Tuned uses profiles to do this. A profile is a set of rules that defines certain system parameters such as disk settings, kernel parameters, network optimization settings, and many other aspects of the system.

What is the difference between capacity planning and performance tuning? Performance tuning optimizes your existing system for better performance. Capacity planning determines what your system needs and when it needs it, using your current performance as a baseline.

How to increase performance on Linux?

How to do kernel tuning in Linux?

What is the best performance filesystem for Linux? If you have large files, XFS is the best choice. Because XFS can perform input and output simultaneously, users and front-end applications store and retrieve data more quickly. The ext4 file system is faster when you have limited CPU bandwidth and work with smaller files.

Which Linux has the best performance?

What are the three types of capacity planning? Types of Capacity Planning Capacity planning itself can be split into three types: workforce, product, and tool. Together they ensure that you have the right amount of three main resources for the short- and long-term.

What is the best tool for capacity planning?

What are the four levels of capacity planning?

How to make a Linux system run faster?

Does installing Linux improve performance? Linux doesn't make your laptop faster… technically. The thing is, compared to Windows, Linux puts like 1/5 to 1/10

of load on RAM and the same goes for storage. Less data to process, better performance.

How to improve SSD performance in Linux? Changing the filesystem type to options such as Btrfs or F2FS, enabling TRIM support, adjusting swappiness to a lower value, minimizing access time updates with the noatime option, optimizing I/O schedulers, and regularly monitoring SSD health with tools such as smartctl are all important steps to ensure efficient ...

How to fine tune Linux kernel parameters?

How do I check my Linux kernel level? To check the kernel version in Linux, you can use the following methods: Using the uname command: Run uname -r to display the kernel version. Run uname -a for more detailed information about the kernel, including the release date and system architecture.

Which file to edit for kernel tuning in Linux? The /proc/sys/ directory is a special place on your computer. It lets you see and change the kernel's settings while the computer is running. It's like a control panel for the computer's brain. The sysctl command is an easier way to change these settings.

How do I optimize Linux performance?

What is the fastest performing Linux? 1. Absolute Linux. Absolute Linux is a light and fast desktop distro that comes out of the box with LibreOffice suite and the Firefox browser. It has a 64-bit architecture and is based on the Slackware project.

How to improve hard drive performance in Linux?

What computer runs Linux the best?

Which is a very powerful tool of Linux? Kali Linux is a powerful open-source Operating System designed for Penetration Testing, Ethical Hacking, and Cybersecurity tasks. Developed by Offensive Security, it provides a comprehensive platform with a vast array of pre-installed security tools and utilities.

What is the fastest responsive Linux distro? Puppy Linux The entire OS is small enough to be run entirely in RAM, which makes it extremely fast and responsive.

You can also anchor the distro to your hard disk as well. Despite its small size, there's no beating Puppy for out of the box functionality.

What is the purpose of performance tuning? Improved user experience: By improving system performance, performance tuning can improve the user experience, reducing frustration and increasing productivity. Reduced downtime: By addressing performance issues before they cause downtime, performance tuning can reduce the risk of outages and associated costs.

What does tuned do in Linux? Tuned is a daemon that uses udev to monitor connected devices and statically and dynamically tunes system settings according to a selected profile. Tuned is distributed with a number of predefined profiles for common use cases like high throughput, low latency, or powersave.

What does tuning mean in performance testing? Performance tuning aims to improve the performance of a software system without changing its functionality or behavior. Performance tuning can be done at any stage of the SDLC, but it is usually done after performance testing has identified the areas that need improvement.
