SQL Practice Exercises with Solutions

SQL (Structured Query Language) is a powerful tool for managing and querying data in relational databases. To hone your SQL skills, it's essential to practice regularly. Below are five SQL practice exercises with step-by-step solutions to help you master the basics:

Exercise 1: Select All Rows from a Table

```
SELECT *
FROM table_name;
```

Solution: This query selects all rows from the specified table and displays all columns.

Exercise 2: Filter Rows Based on a Condition

```
SELECT *
FROM table_name
WHERE column_name = 'condition';
```

Solution: This query filters rows from the specified table based on a condition. For example, it could retrieve all rows where the `status` column has the value `'active'`.

Exercise 3: Group and Aggregate Data

```
SELECT column_name, COUNT(*)
FROM table_name
GROUP BY column_name;
```

Solution: This query groups rows by a specified column and calculates an aggregate function, such as `COUNT()`, for each group. For instance, it could count the number of rows in each `category` group.

Exercise 4: Join Two Tables

```
SELECT *
FROM table1
INNER JOIN table2
ON table1.id = table2.id;
```

Solution: This query joins two tables based on a common column. In this case, it joins the `table1` and `table2` on the `id` column, allowing you to retrieve data from both tables simultaneously.

Exercise 5: Update Table Data

```
UPDATE table_name
SET column_name = 'new value'
WHERE condition;
```

Solution: This query updates the specified column in the table, changing values that meet a condition. For example, it could update the `name` column for all rows where the `age` column is greater than 25.

By practicing these exercises, you can develop a solid understanding of SQL syntax and prepare for real-world data manipulation scenarios. Remember, consistency and repetition are key to mastering any skill, so stay committed to your SQL practice.
