Theory of Computation, 3rd Edition Solution

Question 1:

Describe the difference between a regular language and a context-free language.

Answer:

A regular language is a language that can be generated by a finite state automaton, while a context-free language is a language that can be generated by a context-free grammar. Regular languages are closed under union, intersection, and concatenation, while context-free languages are not.

Question 2:

Explain the Pumping Lemma for regular languages.

Answer:

The Pumping Lemma for regular languages states that for any regular language L, there exists a pumping length p such that any string w in L with length greater than or equal to p can be pumped, meaning it can be divided into three parts, u, v, and w,

where uv^i w is also in L for all i ? 0.

Question 3:

What is the decidability problem for context-free languages?

Answer:

The decidability problem for context-free languages is to determine, given a context-free grammar G, whether L(G), the language generated by G, is empty. This problem is undecidable, meaning that there is no algorithm that can solve it in all cases.

Question 4:

Define a Turing machine and its states.

Answer:

A Turing machine is a theoretical computing device that consists of a tape divided into cells, a head that can read and write to the tape, a finite set of states, and a transition function that determines the behavior of the machine based on its current state and the symbol on the tape under the head. The states of a Turing machine include a start state, one or more accepting states, and one or more rejecting states.

Question 5:

What is the Church-Turing thesis?

Answer:

The Church-Turing thesis states that any function that can be computed by an effective procedure can be computed by a Turing machine. This means that Turing machines are capable of simulating any computable function, and therefore, they are a universal model of computation.
