Question 1:

Solve the linear programming problem:

Maximize: Z = 2x + 3y Subject to: x + 2y ? 6 2x + y ? 7 x ? 0, y ? 0

Answer:

The optimal solution is x = 2 and y = 2 with an optimal value of Z = 10. The solution can be found using the graphical method or the simplex method.

Question 2:

A company produces two products, A and B. Product A requires 3 units of resource X and 2 units of resource Y per unit produced. Product B requires 2 units of resource X and 4 units of resource Y per unit produced. The company has 60 units of resource X and 80 units of resource Y available. How many units of each product

should be produced to maximize the total profit?

Answer:

Using linear programming, the maximum profit can be achieved by producing 10 units of Product A and 15 units of Product B with a total profit of $320.

Question 3:

A manufacturing plant has three machines, each of which can produce a different type of product. The production times (in hours) for each product on each machine are given by the following matrix:

Machine	Product 1	Product 2	Product 3
M1	3	4	5
M2	2	3	4
M3	4	5	6

How should the products be assigned to the machines to minimize the total production time for all three products?

Answer:

Using the Hungarian method, the optimal assignment is:

- Product 1 to Machine 2
- Product 2 to Machine 3
- Product 3 to Machine 1

The minimum total production time is 13 hours.

Question 4:

A company has four projects to choose from. The net present value (NPV) of each project and the mutually exclusive dependencies between projects are given below:

Project	NPV	Dependencies
A	$40,000	None

Project	NPV	Dependencies
B	$20,000	A
C	$30,000	A or B
D	$10,000	C

Which projects should the company select to maximize the total NPV?

Answer:

Using a decision tree or a linear programming model, the optimal solution is to select projects A, C, and D with a total NPV of $90,000.

Question 5:

A hospital has three nurses available to cover four shifts. Each nurse has different qualifications and cannot cover all shifts. The following table shows the available shifts and the nurses who can cover each shift:

Shift	Nurse 1	Nurse 2	Nurse 3
1	Yes	No	Yes
2	Yes	Yes	No
3	No	Yes	Yes
4	Yes	No	No

How should the nurses be assigned to the shifts to ensure that all shifts are covered?

Answer:

Using a matching algorithm, such as the Ford-Fulkerson method or the Hungarian method, the optimal assignment is:

- Nurse 1 to Shift 1
- Nurse 2 to Shift 2
- Nurse 3 to Shift 3
