Signal Analysis with Wavelet Transform using MATLAB

Question 1: What is Wavelet Transform?

Wavelet transform is a mathematical technique that decomposes a signal into a set of time-frequency localized functions called wavelets. It provides a time-scale representation of the signal, allowing for efficient analysis of different frequency components at various time intervals.

Question 2: How is Wavelet Transform Implemented in MATLAB?

MATLAB provides several functions for wavelet analysis, including the 'wavedec' and 'waverec' functions. 'wavedec' decomposes a signal into a set of wavelet coefficients, while 'waverec' reconstructs the signal from the coefficients. The wavelet type and decomposition level can be specified as input parameters.

Question 3: MATLAB Source Code for Wavelet Decomposition

The following MATLAB code demonstrates wavelet decomposition:

```
% Signal definition
signal = sin(2*pi*5*t) + randn(size(t));

% Wavelet decomposition (level 5, Haar wavelet)
[coeffs, l] = wavedec(signal, 5, 'haar');

% Plot wavelet coefficients
figure;
subplot(2,1,1);
plot(signal);
```

```
title('Original Signal');
subplot(2,1,2);
plot(coeffs);
title('Wavelet Coefficients');
```

Question 4: Interpreting Wavelet Coefficients

The wavelet coefficients provide information about the signal's frequency content at different time intervals. Larger coefficients indicate stronger energy in that particular frequency band and time interval. The time-scale resolution is controlled by the wavelet type and decomposition level.

Question 5: Applications of Wavelet Transform

Wavelet transform has numerous applications in signal analysis, including:

- Noise reduction
- Feature extraction
- Time-frequency analysis
- Speech processing
- Image processing
