**What concept does the phrase "turning data terms into golden nuggets of knowledge" signify with respect to data mining?** The widening gap between data and information calls for the systematic development of data mining tools that can turn data tombs into "golden nuggets" of knowledge. We are data rich, but information poor. What Is Data Mining? unknown and potentially useful) patterns or knowledge from huge amount of data.

**What is data mining pdf?** Data mining is a technique for identifying patterns in large amounts of data and information. Databases, data centers, the internet, and other data storage formats; or data that is dynamically streaming into the network are examples of data sources.

**What is the most popular data mining technique?**

**Who invented data mining?** Gregory Piatetsky-Shapiro coined the term "knowledge discovery in databases" for the first workshop on the same topic (KDD-1989) and this term became more popular in the AI and machine learning communities.

**What is the data mining concept?** Data mining is most commonly defined as the process of using computers and automation to search large sets of data for patterns and trends, turning those findings into business insights and predictions.

**What motivates data mining?** The major reason for using data mining techniques is requirement of useful information and knowledge from huge amounts of data. The information and knowledge gained can be used in many applications such as business management, production control etc.

**What is KDD in data mining?** Knowledge Discovery in Databases (KDD) is the process of automatic discovery of previously unknown patterns, rules, and other regular contents implicitly present in large volumes of data. **What is the difference between data warehousing and data mining?** Data warehouse refers to the process of compiling and organizing data into one common database, whereas data mining refers to the process of extracting useful data from the databases. The data mining process depends on the data compiled in the data warehousing phase to recognize meaningful patterns.

**What is data mining and why is it bad?** Data mining refers to digging into collected data to come up with key information or patterns that businesses or government can

use to predict future trends. Data breaches happen when sensitive information is copied, viewed, stolen or used by someone who was not supposed to have it or use it.

**What are data mining algorithms?** An algorithm in data mining (or machine learning) is a set of heuristics and calculations that creates a model from data. To create a model, the algorithm first analyzes the data you provide, looking for specific types of patterns or trends.

**What is a decision tree in data mining?** A decision tree is a non-parametric supervised learning algorithm, which is utilized for both classification and regression tasks. It has a hierarchical, tree structure, which consists of a root node, branches, internal nodes and leaf nodes.
